Abstract of FR2827842

Two types of support (1,2) which may be plastic or card are made opaque by appropriate bedding layers (3) or aluminium tape laminations and then glued together (4) like plywood. A third support (5) is glued to one of the first two supports and receives printing by any of the standard methods. A partial perforation is made near the code to prevent attempts to reveal it by peeling back the supports. Stages of cutting, cleaing and packaging follow
